Infrared leak detector determines surface temperature of objects by measuring infrared energy radiated from surface. It is suitable for measuring surface temperature of various high-temperature, toxic or untouchable objects in short time. This instrument is composed of optical system, photoelectric sensor, signal amplifier, signal processing circuit and LCD display, etc. Optical system transmits infrared energy radiated from the object surface to photoelectric sensor, which converts the energy into corresponding electrical signal. Processed by signal amplifier and signal processing circuit, the signal is displayed on the LCD as digital reading.
